

FinTrack Pro

Product Requirements Document

Full Finance Management System for a Single Company

Version: 1.0 (Draft) | Owner: Product Team | Status: For Review

Prepared for: Internal stakeholders, Engineering, Design

This document defines the product scope, target users, core problem, feature prioritization, user flows, MVP boundaries, and success metrics for FinTrack Pro — a web-based finance management dashboard built for a single company's internal use. It is intended as the primary reference for engineering, design, and stakeholder alignment through the v1 build cycle.

1. Product Overview

FinTrack Pro is a web-based finance management platform built for a single company to centralize its financial reporting, employee-finance data, share performance tracking, and AI-assisted insight generation in one production-ready dashboard. It replaces fragmented spreadsheets, manual slide-building, and ad-hoc reporting with a structured, role-based system.

1.1 Product Vision

Give every finance stakeholder in the company — from data-entry staff to the CFO — a single, trustworthy source of truth for financial performance, with automated reporting and AI support layered on top, so decisions are made faster and with less manual effort.

1.2 Scope of this Document

- Defines what is being built in v1 and explicitly what is deferred.
- Establishes must-have vs nice-to-have feature classification.
- Documents end-to-end user flow from login to report export.
- Sets measurable success criteria for the MVP.

2. Target Users & Personas

Persona	Role	Primary Goals	Pain Point Solved
Admin / Finance Head	Manages system, users, and data sources	Full visibility, control access, oversee reporting accuracy	No centralized control over who sees/edits financial data
Finance Analyst	Enters and reviews financial data	Fast data entry, accurate charts, quick report generation	Manual chart-building and repetitive PPT/PBI creation
CFO / Leadership Viewer	Reviews performance, makes decisions	Quick performance snapshot, trend visibility, share tracking	Waiting on analysts for slide decks and static reports
HR/Finance Coordinator	Maintains employee-designation records	Up-to-date staff directory for the finance department	Employee finance-team data scattered across HR systems

3. Problem Statement

Companies managing internal finance operations typically face four compounding problems:

- **Fragmented data:** Turnover, profit/loss, and share information live across spreadsheets, emails, and verbal updates with no single dashboard of record.

- **Manual reporting overhead:** Power BI datasets and presentation decks are rebuilt from scratch each reporting cycle, consuming analyst hours.
- **No self-service share intelligence:** Leadership has no quick, in-house view of the company's own share value trend, let alone a peer comparison.
- **Unclear finance-team structure:** There is no dedicated, filterable record of who works in the finance department and in what capacity.

■ Assumption to validate with stakeholders: this is an internal tool for ONE company's own finance department, not a multi-client SaaS product. This shapes every scoping decision below.

4. Core Features — Detailed Breakdown

4.1 Feature Classification Key

MUST-HAVE = required for v1 launch; product is not usable without it. **NICE-TO-HAVE** = explicitly deferred to v2+ per Section 8.

4.2 Authentication & Admin Panel — MUST-HAVE

- Email/password login with session management.
- Two roles at launch: **Admin** (full access + user management) and **Viewer/Analyst** (data entry + view, no user management).
- Admin panel: create/deactivate users, assign roles, view audit log of data changes.
- Password reset flow (email-based).

4.3 Finance Dashboard (Turnover & Profit/Loss Visualization) — MUST-HAVE

- Bar chart and pie chart views of turnover and profit/loss.
- Time-range toggle: Daily / Monthly / Yearly, applied consistently across both chart types.
- Manual data entry form + CSV bulk upload for financial records.
- Validation on entry (numeric ranges, required fields, duplicate-date warnings).

4.4 Employee Directory (Finance Department) — MUST-HAVE

- Dedicated page listing employees: name, designation, department, contact detail.
- Filter/search by designation or name.
- Admin can add/edit/remove entries; viewers see read-only list.

4.5 Share Value Tracker — MUST-HAVE (v1) / Comparison — NICE-TO-HAVE (v2)

- v1: Company's own share price shown as a historical line/area chart, sourced from manual/periodic entry (no live market feed in v1 — see Section 8).
- v2 (deferred): Peer comparison board plotting the company's share against other companies, likely requiring a licensed market-data API.

4.6 Report Generation (Power BI & Presentations) — MUST-HAVE (limited)

- v1 ships with 1–2 fixed templates each for Power BI-ready data export and presentation (PPT) export, auto-populated from live dashboard data.
- v2 (deferred): multi-template gallery with many design options and drag-and-drop customization on a dedicated Reports page.

■ Technical clarification needed: 'Generate Power BI' most commonly means exporting a structured dataset/template that Power BI can import (via .pbix template or a published dataset/API connection) — not compiling a native Power BI file entirely server-side. Confirm this definition with engineering before final scoping, since it materially changes build complexity.

4.7 AI Chat & Suggestions — MUST-HAVE (basic) / NICE-TO-HAVE (proactive)

- v1: AI chat answers questions strictly using the company's own uploaded finance data (e.g., "What was Q2 profit vs Q1?").
- v2 (deferred): Proactive AI Suggestions — the system independently flags anomalies or recommends actions without being asked.

4.8 Performance Section — MUST-HAVE

- Summary panel of 4–5 static KPIs: e.g., revenue growth %, net margin, expense ratio, YoY comparison.
- Pulled from the same dataset powering the dashboard charts — no separate data entry.

4.9 Full Feature Matrix

Feature	v1 (Must-Have)	v2+ (Nice-to-Have)
Auth & Admin Panel	Login, 2 roles, user mgmt	Granular per-module RBAC
Dashboard Charts	Bar + pie, daily/monthly/yearly	Custom date ranges, drill-down
Employee Directory	View/add/edit, finance dept only	Org-chart view, cross-dept sync
Share Value	Own company, manual entry	Live feed + peer comparison board
Reports (PBI/PPT)	1–2 fixed templates, auto-fill	Template gallery, drag-drop editor
AI Chat	Reactive Q&A; on own data	Proactive anomaly alerts
Performance Section	4–5 static KPIs	Custom KPI builder
Notifications	Not in v1	Email/SMS threshold alerts
Platform	Responsive web only	Native mobile app

5. End-to-End User Flow

The flow below traces a typical session for both Admin and Analyst/Viewer roles, from authentication through report export.

Step	What Happens
1. Login	User authenticates. System checks role (Admin vs Viewer/Analyst) and routes to Dashboard Home.
2. Dashboard Home	User lands on turnover/profit-loss view. Toggles between bar and pie chart, and between Daily / Monthly / Yearly ranges.
3. Data Entry (Analyst/Admin only)	User manually enters new records or bulk-uploads a CSV. System validates and refreshes charts.
4. Employee Directory	User navigates via sidebar to view finance department staff — name, designation, contact. Admin may add/edit.
5. Reports Page	User selects Power BI export or Presentation export, picks from the 1–2 available templates, system auto-populates from live data, user downloads the file.
6. Share Value Page	User views the company's own historical share value chart.
7. AI Chat	Accessible via persistent icon on any page. User asks a finance question scoped to company data; AI responds inline.
8. Admin Settings (Admin only)	Manage users/roles, review data-change audit log, configure data sources.

6. MVP Definition (v1 Exact Scope)

The MVP is intentionally narrow: one company, two roles, core visualization, basic reporting, and a reactive AI chat. Everything below must be true for v1 to be considered launch-ready.

- Single-tenant (one company only) — no multi-company account switching.
- Two roles only: Admin and Viewer/Analyst.
- Dashboard: bar + pie charts, 3 fixed time filters (daily/monthly/yearly).
- Employee directory: finance department only, basic CRUD for admin.
- Reports: 1–2 fixed templates each for Power BI export and PPT export.
- Share value: own-company chart only, manually/periodically updated data.
- AI chat: reactive Q&A;, scoped strictly to uploaded company finance data.
- Performance section: 4–5 fixed KPIs, no customization.
- Responsive web app only (desktop-first, tablet-usable); no native mobile app.

7. Success Metrics

Metric	Definition	Target (v1)
Activation Rate	% of admins completing first data upload within 7 days of account creation	≥ 70%
Weekly Active Usage	Distinct dashboard views per week among licensed users	≥ 3 sessions/user/week
Report Export Volume	# of Power BI + PPT exports generated per month	Track baseline; grow QoQ
AI Chat Engagement	Query volume and thumbs-up satisfaction rate	≥ 60% positive feedback
Reporting Time Saved	Self-reported reduction in report-prep time (survey)	≥ 50% reduction
Data Accuracy Complaints	# of reported data-integrity issues per month	Near-zero (critical for finance)

8. Explicitly NOT Building in v1

The following are deliberately out of scope for v1. Each is a candidate for a future version, not a rejected idea.

- **Multi-company / multi-tenant SaaS architecture** — v1 serves one company only.
- **Live peer share-comparison board** — requires a licensed market-data feed; deferred pending vendor/API decision.
- **Full Power BI / PPT template marketplace** — v1 ships with 1–2 fixed templates only.
- **Proactive AI anomaly detection / suggestions** — v1 AI is reactive Q&A; only.
- **Native mobile application** — v1 is responsive web only.
- **Billing/subscription/payment system** — not applicable to a single internal-use tool.
- **Integration with external accounting software** (Tally, QuickBooks, Zoho Books, etc.) — strong v2 candidate once core dashboard is validated.
- **Real-time live stock ticker** — v1 share data is manual/periodic entry, not a live market feed.

■ **Accuracy note:** This PRD is a strategic/product draft derived from your stated requirements — it contains no external factual claims needing verification. One item flagged above (Section 4.6) is a technical-definition ambiguity, not a factual error, and should be confirmed with engineering before development begins.
